

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

ON JAPANESE CHRONOLOGY AND CALENDARS.

(Read before the Asiatic Society of Japan, 10th February, 1880.)

In the following I have endeavoured to arrange all the details I have been able to collect regarding Japanese Chronology and Calendars, and though for the sake of completeness I have had to include what is perhaps known to many, I trust the paper will at the same time be found to contain matters that have not yet been explained, or insufficiently so.

I. SYSTEMS OF COUNTING YEARS.

We find in Japan four different ways of counting the years, viz :

By the reigns of the Emperors.

By year-periods (*Nen-gō*).

By the Sexagenary Cycle.

By a continuous era commencing with the first year of the reign of *Jimmu Tennō*.

1. COUNTING BY THE REIGNS OF THE EMPERORS.

By this system the different years of each reign were designated by numbers, the series, commencing with 1, being continued until a new emperor ascended the throne. It was a rule, that when a change of emperor took place, the reign of the new monarch was counted as commencing with the new-year's day *following* his succession, while the whole of the year in which an emperor died or abdicated was considered as belonging to his reign.

In the earliest Japanese historical works, the years are counted in accordance with this system, and if we calculate backwards by the reigns assigned to the monarchs of Japan, we find, that the first emperor, *Jimmu Tennō*, should have founded the empire in the year 660 B.C. It will, however, later on be shown, that these records cannot be relied upon.

2. COUNTING BY *NEN-GŌ*.

In the 4th year of the reign of *Kwō-gioku Tennō* (645 A.D.) the system of counting the years by the reigns of the monarchs was replaced by the mode which had been in use in China since about 168 B.C., viz. of counting by periods of no fixed length, each bearing a distinctive name. The first period in Japan was called *Tai-kwa*, commencing as aforesaid with the year corresponding to 645 A.D.* The names of these periods are called 年号, *Nen-gō*.

This system seems not to have become firmly established at once, for we find, that under *Sai-mei* (655-661 A.D.), *Ten-ji* (662-671 A.D.), *Ji-tō* (687-696 A.D.) and during part at the reign of *Mom-mu* (697-707 A.D.), no *Nen-gō* were used, the years being as in former days counted by the reigns of the emperors. In the absence of regular *Nen-gō* for these intervals, Japanese chronological works sometimes give as such the names of the said four monarchs.

The year contained in each period are numbered 1, 2, 3 and so on, in the same way as when counting the years of the reigns of the monarchs. The *Nen-gō* is generally composed of two, in exceptional cases of four Chinese Characters, usually possessing some felicitous meaning. Thus *Ten-pō* means Heavenly Protection; *Kwan-sei*, Benevolent Government; *Mei-ji*,

* It was in reality *Kō-toku Tennō* who, on succeeding to the throne in the 7th month, adopted the *Nen-gō* system. The year in which the change took place is therefore, if counted by the old system, *Kwō-gioku's* 4th year, while according to the new method it must be called *Tai-kwa* 1st year.

Enlightened Peace. At times a *Nen-gō* was chosen, the characters of which bore a relation to certain important events; thus on the first coining of copper in Japan, in A.D. 708, a new *Nen-gō* was formed from the two characters 和銅. *Wa-dō*, meaning Japanese Copper.

The following table shows all the characters used in forming *Nen-gō*, arranged according to the number of strokes contained in each. Among them the three characters 智, 持, 統, are not used in *Nen-gō* proper, being in reality component parts of the names of those emperors, who as before stated, omitted to choose any *Nen-gō*.

ON JAPANESE CHRONOLOGY AND CALENDARS.

(Read before the Asiatic Society of Japan, 10th February, 1880.)

In the following I have endeavoured to arrange all the details I have been able to collect regarding Japanese Chronology and Calendars, and though for the sake of completeness I have had to include what is perhaps known to many, I trust the paper will at the same time be found to contain matters that have not yet been explained, or insufficiently so.

I. SYSTEMS OF COUNTING YEARS.

We find in Japan four different ways of counting the years, viz :

By the reigns of the Emperors.

By year-periods (*Nen-gō*).

By the Sexagenary Cycle.

By a continuous era commencing with the first year of the reign of *Jimmu Tennō*.

1. COUNTING BY THE REIGNS OF THE EMPERORS.

By this system the different years of each reign were designated by numbers, the series, commencing with 1, being continued until a new emperor ascended the throne. It was a rule, that when a change of emperor took place, the reign of the new monarch was counted as commencing with the new-year's day *following* his succession, while the whole of the year in which an emperor died or abdicated was considered as belonging to his reign.

In the earliest Japanese historical works, the years are counted in accordance with this system, and if we calculate backwards by the reigns assigned to the monarchs of Japan, we find, that the first emperor, *Jimmu Tennō*, should have founded the empire in the year 660 B.C. It will, however, later on be shown, that these records cannot be relied upon.

2. COUNTING BY NEN-GŌ.

In the 4th year of the reign of *Kirō-gioku Tennō* (645 A.D.) the system of counting the years by the reigns of the monarchs was replaced by the mode which had been in use in China since about 163 B.C., viz. of counting by periods of no fixed length, each bearing a distinctive name. The first period in Japan was called *Tai-kwa*, commencing as aforesaid with the year corresponding to 645 A.D.* The names of these periods are called 年号, *Nen-gō*.

This system seems not to have become firmly established at once, for we find, that under *Sai-mei* (655-661 A.D.), *Ten-ji* (662-671 A.D.), *Ji-tō* (687-696 A.D.) and during part at the reign of *Mom-mu* (697-707 A.D.), no *Nen-gō* were used, the years being as in former days counted by the reigns of the emperors. In the absence of regular *Nen-gō* for these intervals, Japanese chronological works sometimes give as such the names of the said four monarchs.

The year contained in each period are numbered 1, 2, 3 and so on, in the same way as when counting the years of the reigns of the monarchs. The *Nen-gō* is generally composed of two, in exceptional cases of four Chinese Characters, usually possessing some felicitous meaning. Thus *Ten-jō* means Heavenly Protection; *Kwan-sei*, Benevolent Government; *Mei-ji*,

* It was in reality *Kō-toku Tennō* who, on succeeding to the throne in the 7th month, adopted the *Nen-gō* system. The year in which the change took place is therefore, if counted by the old system, *Kirō-gioku's* 4th year, while according to the new method it must be called *Tai-kwa* 1st year.

Enlightened Peace. At times a *Nen-gō* was chosen, the characters of which bore a relation to certain important events; thus on the first coinage of copper in Japan, in A.D. 708, a new *Nen-gō* was formed from the two characters 和銅. *Wa-dō*, meaning Japanese Copper.

The following table shows all the characters used in forming *Nen-gō*, arranged according to the number of strokes contained in each. Among them the three characters 智, 持, 統, are not used in *Nen-gō* proper, being in reality component parts of the names of those emperors, who as before stated, omitted to choose any *Nen-gō*.

龜 ki	曆 reki, riaku	銅 dō	嘉 ka	萬 man	喜 ki	授 ju	神 shin, jin	建 ken	享 kiō	亨 kō	安 an, (nan)	正 shō, jō	文 bun, mon	久 kiū
賤 rei	應 ō, gō	禎 tei	養 yō	寬 kuan	勝 shō	鳥 chō	祚 so	貞 tei jō	長 chō	昌 shō	同 dō	弘 kō	化 kwa	大 dai, tai
觀 kuan	衡 kō	德 toku	壽 ju	齊 sai	統 tō 3	祥 shō	泰 tai	保 hō	明 mei	和 kwa, wa	吉 kitsu	白 haku	中 chū	天 ten
	寶 hō	興 kō	福 fuku	雉 chi	景 kei	國 koku	乾 ken	持 ji	治 chi, ji	承 shō, jō	字 ji	至 shi	永 ei, gō	元 gen, guan
	謏 gō	慶 kei, kiō	鳳 hō	祿 roku	雲 un	智 ji	康 kō	政 sei	武 mu	延 en	老 rō	朱 shu, su	个 kō, hiō	仁 nin, nī

A *Nen-gō* may often be pronounced in two or more ways, of which the one that was in use during the period it gives its name to, is properly the correct one, the others having their origin in the various pronunciations given to the same characters at different times. The correct pronunciation is, however, not always the one in general use, the modern sound being naturally preferred to the ancient, perhaps obsolete one.

The periods into which time is divided by the *Nen-gō* system are of no fixed length, the *Nen-gō* being changed whenever some important or memorable event took place. Many *Nen-gō* have only lasted one year, while several comprise over twenty years. The period *Ō-ei* reaches the greatest length, covering 34 years (A.D. 1394-1427).

Changes in the style of the *Nen-gō* do not take place on new-year's days in preference to any other day of the year. We have already seen that when the time was counted by the reigns of the emperors, it was customary to let the new reign date from the first day of the year following that in which the change of monarch took place. In the case of changes of *Nen-gō*, the rule is just the opposite, the new period, as soon as chosen, being counted back as commencing with the first day of the year in which the change is effected. Thus when in the 11th month of the 9th year of *Mei-wa* it was decided to change the *Nen-gō* into *An-ei*, the former designation was at once dropped, and the term *An-ei* 1st year adopted as applying to the whole year from its beginning. This system is somewhat inconvenient, because while books, documents etc. written during the earlier part of the year would, in the above instance, be dated *Mei-wa* 9th year, everything written after the adoption of the new *Nen-gō*, even if referring to events falling before the change, would mention the year as *An-ei* 1st. The inconvenience is at times increased through the delay that in those days would necessarily occur before the change of a *Nen-gō* could be notified throughout the country. Thus when the *Nen-gō* was altered late in the year, the news of the change might not reach some provinces in time to prevent the old name being carried into another year, so that what in the above instance should properly be *An-ei* 2nd year, might in distant parts of the country be designated *Mei-wa* 10th year.

In 1867 the *Nen-gō* was altered to *Mei-ji*, and it was at the same time decreed, that henceforth the style of the *Nen-gō* should only be changed at the commencement of the reign of a new emperor. In China this rule has been in force since the time of the first emperor of the Ming dynasty, about 1366 A.D.

The two systems here mentioned, viz. of counting by the years of the monarchs and by *Nen-gō* are both extremely inconvenient. Without the aid of a hand-book, the indications convey no idea of the relative position, in time, of historical events, and this fact constitutes a considerable impediment to the acquirement of a historical knowledge of the country.

3. THE SEXAGENARY CYCLE.

The mode of counting the years by the above named cycle is borrowed from China, where it has been in use since the 61st year of the reign of the Emperor *Huang-ti* (2637 B.C.). It is not known when it was first introduced into Japan, but it may be surmised, that it was brought there at the same time as the first Chinese books, viz. A.D. 284.

The cycle is formed by combining two separate series of characters as follows :

One series is derived from the five elements *ki*, *hi*, *tsuchi*, *kane*, *mizu* (wood, fire, earth, metal and water) each of which is divided into *e* and *to*, elder and younger brother. A separate character being given to each division, we obtain :

1	甲	ki no e
2	乙	ki no to
3	丙	hi no e
4	丁	hi no to
5	戊	tsuchi no e
6	巳	tsuchi no to
7	庚	ka* no e
8	辛	ka no to
9	壬	mizu no e
10	癸	mizu no to

This series of ten is called *Ten-kan*, 天幹; or *Jik-kan* 十幹, also written 十干, "the ten celestial stems".

* *ka* is an abbreviation of *kane*.

The other series consists of twelve characters, named after the signs of the Zodiac :

1	子	ne	the rat
2	丑	ushi	the bull
3	寅	tora	the tiger
4	卯	u	the hare
5	辰	tatsu	the dragon
6	巳	mi	the serpent
7	午	uma	the horse
8	未	hitsuji	the goat
9	申	saru	the ape
10	酉	tori	the cock
11	戌	inu	the dog
12	亥	i	the boar

These are called *Chi-shi* 地支, or *Ju-ni-shi* 十二支, the "twelve terrestrial branches."

The Ten Celestial Stems are now combined with the Twelve Terrestrial Branches, so as to form groups of two characters.

The simplest way to effect this would seem to be to have first prefixed *ki-no-e* to each of the twelve branches ; thereafter prefixing *ki-no-to* to each branch ; then using *hi-no-e* in the same manner, and so on through the ten stems. In this way we would have obtained one grand cycle of 120 (10×12) combinations. This, however, is not the way the two cycles are used. They are both supposed to be constantly progressing, as will now be described. Let us imagine a clock with two hands, one long and one short, each having its own graduated scale ; the scale of the long hand being divided into ten, and that of the short hand into twelve equal parts, the marks of division being so arranged, that in the place generally marked 1 in an ordinary clock, one of the marks of the outer scale falls in the same radius as one of those of the inner scale. The divisions of the outer circle are named after the ten celestial stems, while those of the inner one are called after the twelve terrestrial branches, both series commencing at the aforesaid coinciding points. (See Fig. 1)

Fig. 1.

Fig. 2.

The Sexagenary Cycle.		No	Uak	Tora	U	Tatsu	Mi	Uma	Hitsuji	Saru	Tori	Inu	I
		子	丑	寅	卯	辰	巳	午	未	申	酉	戌	亥
Ki no e	甲	1		51		41		31		21		11	
Ki no to	乙		2		52		42		32		22		12
Hi no e	丙	13		3		53		43		33		23	
Hi no to	丁		14		4		54		44		34		24
Tsuchi no e	戊	25		15		5		55		45		35	
Tsuchi no to	己		26		16		6		56		46		36
Ka no e	庚	37		27		17		7		57		47	
Ka no to	辛		38		28		18		8		58		48
Mizu no e	壬	49		39		29		19		9		59	
Mizu no to	癸		50		40		30		20		10		60

Let us further suppose that the clockwork is so arranged that the long hand goes round the dial in ten, and the short hand in twelve years. When the hands are set at the aforesaid coinciding points, they will indicate as follows, the long hand being read first :

甲	ki-no-e
子	ne

If the clock is now set going, the hands will at the end of one year point at :

乙	ki-no-to
丑	ushi

In this way the hands advance one division every year, and after ten years the long hand will be back at 甲, while the short one will only have reached 戌. The hands will thus move on for *sixty* years, giving us as many different combinations, before *meeting* at the point whence they first started. The sexagenary cycle then commences again with 甲子.

The accompanying table (Fig. 2) shows the order in which the sixty combinations contained in any one cycle follow each other, one of the Chinese characters in the vertical column being read first followed by one of those in the horizontal line. Thus the 38th combination is *ka-no-to ushi*; the 59th, *mizu-no-e inu*, and so on.

The sexagenary cycle resulting from these combinations is called *Kwa-kō-shi* 花甲子. One cycle of sixty is called *Ik-kō-shi* — 甲子 or *Ichi-gen* — 元. The name given to a year according to this system is called its *E-to*, (from the words *e* and *to*, used in forming the ten celestial stems).

The twelve "terrestrial branches" are sometimes used alone, to indicate the years, without being preceded by one of the "celestial stems." Thus *Tem-pō* 2nd year (1831) may be called "*u no toshi*," the year of the hare, and so might *Tem-pō* 14th year (1843). But it will easily be seen that such indications cannot as a rule be used without leaving a doubt as to the remoteness of the time spoken of. Thus if in *uwa no toshi* one speaks of *u no toshi*, this may mean 3 years ago, or 15 ($12 + 3$), or 27 ($2 \times 12 + 3$) years ago, and so on. There are, however, cases in which the indication is sufficient. Thus if in *saru no toshi*, a person of about twenty years of age states that he was born in *i no toshi*, he must refer to the *preceding cycle but one*, which makes his age 21 years; because if he meant the immediately preceding cycle, he could not be older than 9 years.

When the two series are used together, a little more precision is obtained, through the cycle used being one of sixty years instead of one of twelve. But even here the indication is often ambiguous. If in a year called *tsuchi-no-e, uma no toshi* (the 55th of the table), one speaks of an event that took place in *mizu-no-to, hitsuji no toshi*, (the 20th of the table), he may mean 35 years back; or 95, $(60 + 35)$; or 155, $(2 \times 60 + 35)$ etc. In exceptional cases only is the indication sufficient to convey an idea of the exact time spoken of. Thus if in the year called *ka-no-to, u no toshi* (the 28th of the diagram) an old man gives *tsuchi-no-to, mi no toshi* (the 6th of the diagram) as the year of his birth, he must speak of the sexagenary cycle preceding the existing one, which makes his age 82 years, as it is out of question that he can be either 22 or 142 years old.

In China, this want of precision is by some writers said to be obviated by numbering the sexagenary cycles in a continuous series, the one commencing 2637 B.C. being the first, which gives us the one now in use as the 76th, covering the years 1864 to 1923. I have not been able to verify this statement; but such a course is at least not followed in Japan, if for no other reason, because when the system of counting by the cycle was introduced into Japan, it had already been in use over 2000 years in China, the consequence being that the Japanese could not well start with the number of the contemporary Chinese cycle, as all the previous cycles would be missing in their historical records; nor could they commence a new series, by numbering their own first cycle 1, because the discrepancy thus arising between the numbers of the Chinese cycles and those employed in Japan would likewise at once display the much later origin of Japanese history, a fact which the Japanese dislike to allude to.

The *E-to* is often used in addition to the year of the reign of the emperor, or the *Nen-gō*, thus:

Sai-mei Ten-nō roku nen, ka-no-e saru no toshi.

An-sei ni nen, ki-no-to u no toshi.

The sexagenary cycle affords a great assistance in the study of the history of Japan and China, especially in that of the latter country. Extending back as it does to over 2000 years before Christ, it would have been impossible to fix the true time of the events recorded by Chinese historians had they but given us the name of the emperor or the incessantly changing *Nen-gō*. When the *E-to* of the year is added, as it generally is, it becomes an easy task to calculate all events to a year. For instance, as the year 1879 is the 16th year of the 76th cycle, we have but to count back $75 \times 60 + 16$ years,

to find that the first cycle was instituted in the year 2637 B.C ; and with equal precision the time of any other event may be ascertained. If moreover the *E-to* of the month and day is given, as will be explained hereafter, we are enabled to calculate any event to a day.

4. COUNTING THE YEARS BY ONE CONTINUOUS ERA COMMENCING WITH THE 1ST YEAR OF JIMMU'S REIGN.

This mode of counting the years is quite a modern innovation, adopted in imitation of the Christian era. It has never been in general use, nor is it likely ever to become so.

When placing the commencement of Jimmu's reign in 660 B.C., the year 1880 A.D. is the 2540th after Jimmu Tennō.

II. SUB-DIVISION OF THE YEAR.

1. CALENDARS.

In Japanese Calendars, as introduced from China, the year is divided into lunar months, a new moon marking the beginning of a month. As a lunation is between 29 and 30 days, it becomes necessary to make some months 29 and others 30 days. Had a lunation been exactly 29½ days, months of 29 and 30 days might have followed each other alternately, without interruption ; but as the interval between one new moon and the next is somewhat *over* 29½ days, the long months, of 30 days, must necessarily occur more frequently than those of 29 days.

The rule, according to which the length of the months is regulated in the earliest Chinese and Japanese calendars is as follows :

If the interval between the midnight hour that marks the commencement of the day on which a new moon occurs, and the hour of the next new moon is *less* than 30 days, the month gets only 29 days. Such a month is called 小 *Sho* (short).

If, on the other hand, the said interval amounts to 30 days or over, the month gets 30 days, and is called 大 *Dai* (long).

1. COUNTING BY THE REIGNS OF THE EMPERORS.

By this system the different years of each reign were designated by numbers, the series, commencing with 1, being continued until a new emperor ascended the throne. It was a rule, that when a change of emperor took place, the reign of the new monarch was counted as commencing with the new-year's day *following* his succession, while the whole of the year in which an emperor died or abdicated was considered as belonging to his reign.

In the earliest Japanese historical works, the years are counted in accordance with this system, and if we calculate backwards by the reigns assigned to the monarchs of Japan, we find, that the first emperor, *Jimmu Tennō*, should have founded the empire in the year 660 B.C. It will, however, later on be shown, that these records cannot be relied upon.

2. COUNTING BY *NEN-GŌ*.

In the 4th year of the reign of *Kicō-gioku Tennō* (645 A.D.) the system of counting the years by the reigns of the monarchs was replaced by the mode which had been in use in China since about 168 B.C., viz. of counting by periods of no fixed length, each bearing a distinctive name. The first period in Japan was called *Tai-kwa*, commencing as aforesaid with the year corresponding to 645 A.D.* The names of these periods are called 年号, *Nen-gō*.

This system seems not to have become firmly established at once, for we find, that under *Sai-mei* (655-661 A.D.), *Ten-ji* (662-671 A.D.), *Ji-tō* (687-696 A.D.) and during part at the reign of *Mom-mu* (697-707 A.D.), no *Nen-gō* were used, the years being as in former days counted by the reigns of the emperors. In the absence of regular *Nen-gō* for these intervals, Japanese chronological works sometimes give as such the names of the said four monarchs.

The year contained in each period are numbered 1, 2, 3 and so on, in the same way as when counting the years of the reigns of the monarchs. The *Nen-gō* is generally composed of two, in exceptional cases of four Chinese Characters, usually possessing some felicitous meaning. Thus *Ten-jō* means Heavenly Protection; *Kwan-sei*, Benevolent Government; *Mei-ji*,

* It was in reality *Kō-toku Tenno* who, on succeeding to the throne in the 7th month, adopted the *Nen-go* system. The year in which the change took place is therefore, if counted by the old system, *Kō-gioku's* 4th year, while according to the new method it must be called *Tai-kwa* 1st year.

Enlightened Peace. At times a *Nen-gō* was chosen, the characters of which bore a relation to certain important events; thus on the first coinage of copper in Japan, in A.D. 708, a new *Nen-gō* was formed from the two characters 和銅. *Wa-dō*, meaning Japanese Copper.

The following table shows all the characters used in forming *Nen-gō*, arranged according to the number of strokes contained in each. Among them the three characters 智, 持, 統, are not used in *Nen-gō* proper, being in reality component parts of the names of those emperors, who as before stated, omitted to choose any *Nen-gō*.

ing the hours on which the moons, during that time, will commence. These decimals are, of course, obtained by **always** adding the fraction of the lunation .5305921 to that indicating the hour of the commencement of the preceding new moon.

Let us now, commencing with a new moon that falls exactly at midnight,—consequently containing no decimal fraction,—calculate the decimals marking the hour on which each of a series of about sixty moons commences, and let us further, according to the rule laid down, give 29 days to the month, wherever the decimal fraction is under .4694079, and 30 days, where the fraction is larger. We then get as follows :

Number of moon.	Decimals indicating the time on which the moon commences.	Number of days of ensuing month.	Number of moon.	Decimals indicating the time on which the moon commences.	Number of days of ensuing month.	Number of moon.	Decimals indicating the time on which the moon commences.	Number of days of ensuing month.
1	.0000000	29	22	.1124341	29	43	.2818682	29

20	.0812499	29	41	.2236840	29	62	.3661181	29
21	.6118420	30	42	.7542761	30			

The foregoing gives us, in 62 months, 34 of 30 days and 28 of 29 days; and it will be observed that in this calendar two short months never follow each other, nor will more than two long ones be found together.

Having thus seen the mode in which the length of the months was regulated, we require to know, how they were grouped together into years. The chief object was naturally to adapt the lunar months to the solar year, so as to make the seasons, equinoxes and solstices recur with some degree of regularity in the same months. It is therefore necessary that we should first make ourselves acquainted with the solar year and its divisions.

The estimated length of the solar year is about $365\frac{1}{4}$ days, varying slightly in the calendars that have been in use at different periods. As however these remarks are merely intended to give an idea of the main principles on which the calendar was compiled, it does not matter much whichever length we give to the solar year, and for the sake of convenience I have in the following calculations taken it as equal to 365 days.

The yearly circuit of the sun is divided into twelve parts, the names of which have already been given on page 6. Each of these divisions consequently represents $\frac{1}{12}$ of the solar year, and covers $\frac{30\frac{1}{4}}{12}$ or 30.41667 days. If thus the sun is supposed to start from the division of the rat, at the midnight hour expressed by 0, it will enter the next division, that of the bull, at the day and hour expressed by 30.41667; that of the tiger at 60.83333, and so on.

The radii by which the circuit is divided into the said twelve parts are termed 入節, *Niū-setsu*, or simply *Setsu*, the one preceding the division of the rat being the first. The names of the twelve *Setsu*, and the numbers indicating the day and hour when the sun enters each,—and therefore also representing the position of each *Setsu* in the circuit,—are as follows:

1st	<i>Setsu</i>	Dai-setsu	0.
2nd	„	Shō-kan	30.41667
3rd	„	Ris-shun	60.83333
4th	„	Kei-chitsu	91.25
5th	„	Sei-mei	121.66667
6th	„	Rik-ka	152.08333

7th	Setsu	Bō-shu	182.5
8th	„	Shō-sho	212.91667
9th	„	Ris-shū	243.83333
10th	„	Haku-ro	273.75
11th	„	Kan-ro	304.16667
12th	„	Rit-tō	334.58333

Each of the sectors confined between two *Setsu* is again divided into halves, the dividing radii being in this case called 中節 *Chū-setsu*. Commencing with the one that falls in the sector of the rat, half-way between the 1st and 2nd *Setsu*, and adding the day and hour of the circuit corresponding to each, we get :

1st	Chū-setsu	Tō-ji	15.2083
2nd	„	Dai-kan	45.625
3rd	„	U-sui	76.0417
4th	„	Shun-bun	106.4583
5th	„	Koku-u	136.875
6th	„	Shō-man	167.2917
7th	„	Ge-shi	197.7083
8th	„	Dai-sho	228.125
9th	„	Sho-sho	258.5417
10th	„	Shū-bun	288.9583
11th	„	Sō-kō	319.375
12th	„	Shō-setsu	349.7917

The sun is considered to be in the first *Chū-setsu*, *Tō-ji*, at winter solstice (22nd December), and the solar year begins with the preceding *Setsu*, *Dai-setsu*, (consequently the 8th December).

Fig. 8.

It will be seen that the *Setsu* and *Chū-setsu* indicate the seasons with much more precision than the lunar calendar, holding, as they do, a fixed position in the solar year. Hence it was common,—especially among farmers and sailors,—to calculate according to the *Setsu*; and the yearly calendars always stated on what particular days the *Setsu* and *Chū-setsu* occurred for the current year.

The accompanying Fig. 3 shows the twelve signs of the zodiac, the *Setsu* and *Chū-setsu*, and the day of the Gregorian calendar corresponding to each. As will be shown hereafter, the length given to the intervals between the different *Setsu* and *Chū-setsu* underwent certain changes in later calendars, in consequence of which the day of the solar year corresponding to each was not the same in the various calendars that have been in use. In the figure here given the dates of the Gregorian calendar appended to the *Setsu* and *Chū-setsu* are those they held in the last calendar used in Japan. In leap-years one day must be deducted from the dates given.

The civil year does not commence at the same time as the solar one, the new-year's day of a normal civil year falling on the day when the sun is in the 3rd *Setsu*, *Risshun* (4th February).

In trying to adapt a civil year, composed of lunar months, to the solar year, we meet with the difficulty that the latter, which consists of about 365 days, is not a multiple of the number of days contained in a lunation, as twelve moons will cover only about 354 days, while thirteen moons will aggregate about 384 days. In giving the ordinary civil year only twelve lunar months, as the Chinese and Japanese do, the said year will consequently be about 11 days shorter than the solar year; or in other words, the new-year's day of a civil year will fall about 11 days earlier than the new-year's day of the preceding year. After the lapse of another civil year of 12 months, the error will amount to about 22 days, and thus the discrepancy will steadily increase, throwing the seasons entirely out of their proper places in the calendar.

To remedy this an intercalary month is inserted occasionally, and the discrepancy between the civil and solar years thereby always kept within certain limits. Such a month, as will be shown hereafter, has to be intercalated once in about 33 months. When a year in this way comes to contain 13 months, the intercalary one is always called by the name of the preceding month, with the word *Urō* added: thus an intercalary month inserted after the 8th month, is called *Urō hachi gwatsu*.

The way in which the proper places of intercalation are calculated is best explained as follows:

Let us imagine the moon travelling round the same circuit and with the same speed as the sun, meanwhile increasing and decreasing in its usual course. If starting on the new-year's day of the civil year,—consequently being then a new moon,—from the 3rd *Setsu*, that is, on the day of the solar year corresponding to 60.89888, the next new moon will occur one lunation, i. e. 29.5305921 days later, consequently at the hour and place expressed by 90.8639221, and thus after the moon has passed the 3rd *Chū-setsu*, but somewhat before it has entered the 4th *Setsu* 91.25. The next new moon after that will occur on the expiry of another 29.5305921 days, that is at the hour and place expressed by 119.8945142, thus after the moon has passed the 4th *Chū-setsu*, but still more in advance of the 5th *Setsu*, 121.66667, than in the case of the preceding moon. The new moons will thus gradually fall more and more in advance of the *Setsu*, and if the moon continues in the circuit for a certain time, we shall at last get a new moon so close after the moon's passing a *Chū-setsu*, that the following new moon will take place before it reaches the next *Chū-setsu*. We thus obtain a moon, that does not pass through any *Chū-setsu* at all.

The rule followed in compiling the calendar is, that *those moons, that do not contain any Chū-setsu become intercalary months.*

It will easily be understood that the above procedure is but a practical way of illustrating the difference between the length of the lunar month and the twelfth part of the solar year. Had a lunation been exactly $1/12$ of the solar year, we should always have new moon at *Setsu*, and full moon at *Chū-setsu*. But as the lunation is in reality shorter than $1/12$ of the year, the full moons will occur before *Chū-setsu*, and the new moons before *Setsu*, and gradually more in advance of the same; and when at last a new moon falls so much ahead of the *Setsu*, that the ensuing lunation will be completed before the moon reaches *Chū-setsu*—which ought to have fallen in the middle of the month—then this merely signifies, that the discrepancy between the civil and solar years now exceeds half a month, and that therefore a correction is necessary. Hence the rule, that when a month contains no *Chū-setsu* it is intercalary.

Let us now apply this rule to the series of 62 months, of which above we calculated the length, taking them one by one, and making intercalary months of those that contain no *Chū-setsu*, at the same time grouping them into years; and let us, in this calculation, give the months 29 or 30 days, as they may have been allotted in the list already given, thereby avoiding the decimal fraction of the lunation.

ing the hours on which the moons, during that time, will commence. These decimals are, of course, obtained by always adding the fraction of the lunation .5305921 to that indicating the hour of the commencement of the preceding new moon.

Let us now, commencing with a new moon that falls exactly at midnight,—consequently containing no decimal fraction,—calculate the decimals marking the hour on which each of a series of about sixty moons commences, and let us further, according to the rule laid down, give 29 days to the month, wherever the decimal fraction is under .4694079, and 30 days, where the fraction is larger. We then get as follows :

Number of moon.	Decimals indicating the time on which the moon commences.	Number of days of ensuing month	Number of moon.	Decimals indicating the time on which the moon commences.	Number of days of ensuing month.	Number of moon.	Decimals indicating the time on which the moon commences.	Number of days of ensuing month.

17	.4894736	30	38	.6319077	30	59	.7743418	30
18	.0200657	29	39	.1624998	29	60	.3049339	29
19	.5506578	30	40	.6930919	30	61	.8355260	30
20	.0812499	29	41	.2236840	29	62	.3661181	29
21	.6118420	30	42	.7542761	30			

The foregoing gives us, in 62 months, 34 of 30 days and 28 of 29 days ; and it will be observed that in this calendar two short months never follow each other, nor will more than two long ones be found together.

Having thus seen the mode in which the length of the months was regulated, we require to know, how they were grouped together into years. The chief object was naturally to adapt the lunar months to the solar year, so as to make the seasons, equinoxes and solstices recur with some degree of regularity in the same months. It is therefore necessary that we should first make ourselves acquainted with the solar year and its divisions.

The estimated length of the solar year is about $365\frac{1}{4}$ days, varying slightly in the calendars that have been in use at different periods. As however these remarks are merely intended to give an idea of the main principles on which the calendar was compiled, it does not matter much whichever length we give to the solar year, and for the sake of convenience I have in the following calculations taken it as equal to 365 days.

The yearly circuit of the sun is divided into twelve parts, the names of which have already been given on page 6. Each of these divisions consequently represents $\frac{1}{12}$ of the solar year, and covers $\frac{305}{12}$ or 30.41667 days. If thus the sun is supposed to start from the division of the rat, at the midnight hour expressed by 0, it will enter the next division, that of the bull, at the day and hour expressed by 30.41667; that of the tiger at 60.83333, and so on.

The radii by which the circuit is divided into the said twelve parts are termed 入節, *Niū-setsu*, or simply *Setsu*, the one preceding the division of the rat being the first. The names of the twelve *Setsu*, and the numbers indicating the day and hour when the sun enters each,—and therefore also representing the position of each *Setsu* in the circuit,—are as follows:

1st	Setsu	Dai-setsu	0.
2nd	„	Shō-kan	30.41667
3rd	„	Ris-shun	60.83333
4th	„	Kei-chitsu	91.25
5th	„	Sei-mei	121.66667
6th	„	Rik-ka	152.08333

We have now actually compiled the calendar for five consecutive years, the result being as follows :

	1st year.	2nd year.	3rd year.	4th year.	5th year.
1st month	29	29	29	30	30
2nd „	30	30	30	29	30 } Interc: 29 }
3rd „	29	29	29	30	30
4th „	30	30	30	29	29
5th „	29	30 } Interc: 29 }	29	30	30
6th „	30	30	30	29	29
7th „	29	29	29	30	30
8th „	30	30	30	29	29
9th „	29	29	30	30	30
10th „	30	30	29	29	29
11th „	29	29	30	30	30
12th „	30	30	29	29	29

In the foregoing I have described the main principles followed in compiling the first Chinese Calendar. Other minor items were taken into calculation, to explain which would be beyond the scope of this paper, as it would necessitate a familiarity not only with European, but also with the intricacies of Chinese Astronomy.

The differences between the numerous calendars that have been in use in China and Japan consist chiefly of some slight variation in the length of the solar year and the lunation, as well as a different estimate of the precession of the equinoxes, which was known to the Chinese in very remote days, though they were unacquainted with the real cause of it.

I must, however, make a few remarks on one new feature in the later calendars. At first, no account was taken of the fact, that the time from the vernal to the autumnal equinox is about 186 days while that from the autumnal to the vernal equinox is only about 179 days, and the early astronomers found it convenient to give all of the twelve portions, into which the circuit of the sun was divided by the *Setsu*, the length of about 30.41667 days, this being in reality the mean length of the said divisions. The equinoxes were thus placed diametrically opposite to each other, at *Shum-bun* and *Shū-bun*, and did therefore not occupy their true places in the solar year. One consequence of this arrangement was, that the distance between any two *Setsu* or any two *Chū-setsu* being always 30.41667 days, i.e. more than a lunation, it was quite impossible that two *Setsu* or two *Chū-setsu* could fall within the same month.

In later calendars the *Setsu* and *Chū-setsu* were arranged with a view of making the *Shum-bun* and *Shū-bun* really correspond to the equinoxes. Thus in the calendar known to the Japanese as the *Gihō-reki*, the distances between the *Setsu* and *Chū-setsu* were as follows :

1st <i>Setsu</i>	to	1st <i>Chū-setsu</i>	14	$\frac{5405}{3040}$	days.
1st <i>Chū-setsu</i>	„	2nd <i>Setsu</i>	14	$\frac{5405}{3040}$	„
2nd <i>Setsu</i>	„	2nd <i>Chū-setsu</i>	14	$\frac{5405}{3040}$	„
2nd <i>Chū-setsu</i>	„	3rd <i>Setsu</i>	14	$\frac{5712}{3040}$	„
3rd <i>Setsu</i>	„	3rd <i>Chū-setsu</i>	14	$\frac{5712}{3040}$	„
3rd <i>Chū-setsu</i>	„	4th <i>Setsu</i>	14	$\frac{5405}{3040}$	„

Total, 365 $\frac{4366}{5040}$ days, or one solar year.

As in this same calendar the lunation is estimated at 29 $\frac{4366}{5040}$ days, we find that out of the 24 divisions of the sun's circuit, eight are *shorter than half of a lunation*; and that, as these short divisions occur in groups, a lunation may at times happen to cover two *Setsu* and one *Chū-setsu*, or two *Chū-setsu* and one *Setsu*. To prevent this, the months had to be made short in some places where they really ought to have been long; hence we shall in the *Gihō-reki* often find *two* or *three* short months following each other, to make up for which, in other places *three*, and occasionally even *four* long months will be found together. Such was never the case in the old calendars, in which, as already shown, two short months could not follow one another.

The following is a list of the various Calendars used in Japan :

GEN-KA REKI 元嘉曆, from *Ji-tō* 4th till *Ji-tō* 10th year (690-696 A.D.) This is the Calendar first used in China in the 22nd year of *Gen-ka* (445 A.D.)*

GI-HŌ REKI 儀鳳曆, from *Mom-mu* 1st till *Tem-biō Hō-jī* 7th year (697-763 A.D.) This calendar is the Chinese *Rin-toku Reki*, used there from 664 A.D. I have not been able to ascertain why the Japanese call this calendar after the Chinese period *Gi-hō*, which commenced thirteen years after the *Rin-toku Reki* was adopted in China.

DAI-EN REKI 大衍曆, from *Tem-biō Hō-jī* 8th year till *Ten-an* 1st year (764-857 A.D.) This is the Chinese calendar of the same name, first used in the 17th year of *Kai-gan* (729).

GO-KI-REKI 五紀曆, from *Ten-an* 2nd year till *Jō-gwan* 3rd year (858-861 A.D.), being the Chinese Calendar of the same name, used there since *Hō-ō* 1st year (762).

SEM-MEI REKI 宣明曆, from *Jō-gwan* 4th year till *Jō-kiō* 1st year (862-1684.) This calendar was used in China from *Chō-kei* 2nd year (822).

JŌ-KIŌ REKI 貞享曆, from *Jō-kiō* 2nd year (1685). This is the Chinese 授時曆, *Juji Reki*, of the year 1335.

The *Jō-kiō Reki* was afterwards improved upon by the Japanese, when they had acquired some knowledge of Western Astronomy.

In the 5th year of *Mei-ji* (1872), the Japanese Government decided to discontinue the system of lunar months, and to adopt in its stead the Gregorian Calendar. As in that year the 2nd day of the 12th month fell on the 31st December 1872, the change was effected by leaving out the remainder of the month. Thus the day following the 2nd day of the 12th month of the 5th year of *Mei-ji*, was called the 1st day of the 1st month of the 6th year of *Mei-ji*, corresponding to the 1st of January 1873.

The system of counting the years by *Nen-gō* remains unchanged with the modification already mentioned, viz : that the style is only changed on the ascension to the throne of a new emperor.

* This and subsequent Chinese *Nen-gō* are given with their Japanese pronunciation.

2. SEXAGENARY CYCLE APPLIED TO MONTHS AND DAYS.

Months and days are, like years, counted by sexagenary cycles, independently of each other. If we thus take *Mei-ji* 4th year 3rd month 6th day, the *year* is the 8th of a cycle of 60 years, its *E-to* being *Ka-no-to, hitsuji*; the *month* is the 29th of a cycle of 60 months, its *E-to* being *Mizu-no-e, tatsu*; and the *day* is the 38rd of a cycle of 60 *days*, having for its *E-to* *Hi-no-e, saru*.

The intercalary months of the Japanese year have no separate *E-to*, but bear the same name as the preceding month, so that though a year may contain thirteen months, yet never more than twelve *E-to* are used to designate its months. At will be shown below, some regularity is, in consequence, obtained in the application of the cycle to the months, the same *E-to* after a fixed interval recurring in the same months of the year.

Owing to the way in which the sexagenary cycle is produced, it is obvious that the 1st, 13th, 25th, 37th and 49th combinations must all *end* in the same character, and so must any two *E-to* of which the corresponding numbers show a difference of 12, or of a multiple of 12. Consequently, as only twelve *E-to* are used to designate the months of a year, the *E-to* of a month will always end in the same character as the *E-to* of the same month in any other year, while the first character may differ. We shall thus always find that :

1st month	is	Tora
2nd	„	„ U
3rd	„	„ Tatsu
4th	„	„ Mi
5th	„	„ Uma
6th	„	„ Hitsuji
7th	„	„ Saru
8th	„	„ Tori
9th	„	„ Inu
10th	„	„ I
11th	„	„ Ne
12th	„	„ Ushi

PERPETUAL TABLE, SHOWING THE E-TO OF ANY JAPANESE MONTH.	IF THE YEAR FROM JIMMU TENNŌ OR THE CORRESPONDING EUROPEAN YEAR ENDS IN:				
	1	2	8	4	5
	or 6	or 7	or 8	or 9	or 0
1st month...	27	39	51	8	15
2nd „ ...	28	40	52	4	16
3rd „ ...	29	41	53	5	17
4th „ ...	30	42	54	6	18
5th „ ...	31	43	55	7	19
6th „ ...	32	44	56	8	20
7th „ ...	33	45	57	9	21
8th „ ...	34	46	58	10	22
9th „ ...	35	47	59	11	23
10th „ ...	36	48	60	12	24
11th „ ...	37	49	1	13	25
12th „ ...	38	50	2	14	26

But more than this, after the lapse of 60 months, i.e. 5 years, the sexagenary cycle will be completed, and both characters composing the *E-to* of a month will become the same as those of the same month five years previous. Thus, as the 11th month of *Tem-pō* 4th year was *Ki-no-e, ne*, the 11th month of *Tem-pō* 9th year will also be *Ki-no-e, ne*, whereupon the cycle will go on for another five years in the same rotation.

By aid of the accompanying table the *E-to* of any month may be ascertained, if the year from Jimmu Tennō, in which the month falls, or the corresponding year of the Christian era is known. The numbers given in the table may be interpreted by referring to Fig. 2 on page 8.

Example: What is the *E-to* of the 8th month of *Wadō* 3rd year? *Wadō* 3rd year is the 1370th after Jimmu Tennō, or 710 A.D., both ending in O. Consequently the 8th month of that year is Nr. 23 of a cycle, which according to Fig. 2 is *Ki-no-to, tori*.

It will be noticed that the commencement of a new cycle does not fall in the 1st month of the civil year, but in the 11th, the latter corresponding to the 1st month of the *solar* year.

In the application of the sexagenary cycle to the *days* of the Japanese calendar, no such regularity exists in the recurrence of the same *E-to* on certain days, owing to the years and months not always containing the same number of days.

III. DIVISION OF TIME PRIOR TO THE INTRODUCTION OF CHINESE CALENDARS.

I have deferred to the last the question: In what way did the Japanese count the time prior to the introduction of Chinese Calendars? My reason for doing so is, that nothing certain is known in this respect, and that any speculations on this subject must necessarily embrace other matters, such as the true period to be assigned to the commencement of the history of Japan, and the authenticity of its ancient historical records.

The only facts at our disposal, bearing on the subject are :

That in the 15th and 16th year of the reign of *Ō-jin Tennō*, corresponding, according to the calculations generally followed, to 284 and 285 A.D., *Atogi* and *Wani* brought the first knowledge of the Chinese written character and specimens of Chinese literature to Japan. *120 years before by Korean records*

That *Wani* was appointed tutor to the Imperial prince, and that during the reign of *Ō-jin's* successor, *Nin-toku Tennō*, the study of Chinese literature was embraced by a number of Japanese of the higher classes.

That in the 10th year of *Suikō Tennō* (602 A.D.) chronological and astronomical works, and also a movable disk for calculating calendars, were brought to Japan from Corea.

That in the 4th year of *Haiku-hō* (675 A.D.) the first astronomical observatory was erected.

That in the 4th year of *Ji-tō* (690 A.D.) the first official calendar was promulgated.

It is not conceivable that the sexagenary cycle,—the introduction of which into Japan is not recorded,—can have been known and applied to years, months and days, at a time when the Japanese had no written characters, and when the Chinese calendars were totally unknown in the country. We may take it for granted, that when Chinese literature was brought to Japan, those who occupied themselves therewith would for the first time become acquainted with the sexagenary cycle, and also, though still left ignorant of the exact way in which the Chinese compiled their calendars, form some idea of the fact, that the length of the Chinese year was regulated by the solar year. Almost any Chinese work would contain passages alluding, in some way, to the divisions of the year, intercalations etc.,* and we may reasonably surmise, that when during the reign of *Nin-toku*, *Ō-jin's* successor, the study of Chinese literature had reached some degree of advancement, the length of the Chinese year would be sufficiently well known to direct attention to any difference that might exist between it and the *Japanese* year. We here meet with a circumstance of the greatest importance: that with *Nin-toku Tennō* the emperors suddenly cease to reach their former fabulously great ages, and from that time, without exception, only live to such ages as ordinary mortals would attain. That anybody may convince himself of the striking difference in this respect, I subjoin the ages of the seventeen rulers from *Jimmu* to *Nin-toku*, compared with those of the seventeen subsequent monarchs :

* As an instance of how such allusions would occur, it may be mentioned, that the *Sen-ji-mon*, which is said to be one of the first books brought to Japan, contains the following passage: "The superfluities, made into intercalary months, complete the years."

NAME.	AGE.	NAME.	AGE.
Jim-mu	127	Ri-chū	77

Nin-toku	122	Su-jun	73
Total... ..	1858	Total	1046

Average age 109 years.

Average age 61½ years.

A sudden falling off like that above mentioned in the lives of men, who were moreover of the same family, is entirely out of question, the only reasonable solution being, that *the standard by which the years were counted must have been changed*. The question then suggests itself: what was the original length of the year in Japan, and how was it computed? To this I would offer the following reply:

Since the remotest ages, in almost all countries, the *Sun* has naturally decided the length of the year, and it cannot be doubted that this was the case in Japan too, especially as the sun was the particular deity of the country. In the sun's movements four distinct periods must appear even to the most primitive of men, namely the terms, when day and night are of equal length, and those on which the day reaches its maximum and minimum length, i.e. the equinoxes and the solstices. While in most countries the period occupied by the sun in passing through all of these four divisions is called a year, it would be quite natural to count by the shorter periods that form regular portions of the whole circuit, say from Solstice to Solstice, or still better from Equinox to Equinox, owing to their similarity, thereby making two years of what we now call one.

Reverting to the age of the emperors up to *Nin-toku*, as compared with that of the subsequent ones, we see that the latter averages a little more than half of that of their predecessors, and I shall be able to show, that if the suggestion I am going to make, is correct, this slight excess on the half has no actual existence. My opinion is, that *in remote days the Japanese counted their year from equinox to equinox*; that during the reign of *Nin-toku* the Chinese year, of double the length, became generally known; and that with his death it was officially adopted.

If this theory is right, we must remember that the three Emperors *Ri-chū*, *Han-shō* and *In-giō*, who succeeded *Nin-toku*, all lived during his reign; and that, as it is most unlikely the reform in counting the years was made retrospective, the first part of their lives have been counted by the old (short) year, and the latter by the new (long) one.

Thus *Ri-chū*, who reigned 7 years, was "77 years" old, when he died. He therefore lived "70 years" under *Nin-toku's* reign, and was, consequently, in reality $\frac{70}{2} + 7 = 42$ years old, when he died.

The following emperor *Han-shō* reigned 6 years, and died "60 years" old; but as he lived $60 - (6 + 7) = "47 \text{ years}"$ under the old system, he was actually $\frac{47}{2} + 13 = 36\frac{1}{2}$ years old.

The emperor succeeding him, *In-giō*, reigned 43 years, and died "80 years" old, but of these only $43 + 6 + 7 = 56$ were long years; the 24 years which he lived under *Nin-toku's* reign should actually count 12, making his true age 68 years.

If now, in the list of the seventeen emperors after *Nin-toku*, which is given above, we substitute 42, $36\frac{1}{2}$ and 68 for 77, 60 and 80, we get a total of $975\frac{1}{2}$ years, or an average of 57 years against the 109 years of their predecessors. If it be remembered, that the *true* average age of a race cannot be computed from the lives of only seventeen men, as even one case of premature death or unusual long life would materially affect the average in so small a number, it will be admitted, that

the figures 109 and 57 are to a surprising degree in favor of my theory, that the length of the old Japanese year was but half of that introduced from China; for we shall then get the result that the true average age of the 17 first emperors is $\frac{109}{2} = 54\frac{1}{2}$ years, against 57 in the case of their 17 immediate successors, making the average of them all together $55\frac{1}{4}$ years.*

The consequence of this, if correct, will be that *Jimmu Tennō's* place in history is far less remote than is at present thought. *Nin-toku* died in 400 A.D., or "1060 years" after *Jimmu Tennō*; but if the length of these years was but half of our present year, *Jimmu Tennō's* reign commenced 180 B.C., instead of 660 B.C., as generally surmised.

I think the above should at least be accepted as a highly probable suggestion, worthy of further investigation. Should it be found that about 180 B.C. an emigration took place in the South-sea Islands, or in any country from which *Jimmu* is likely to have come, I should look upon it as a decisive proof of the correctness of my theory, and as a solution of the question of the origin of the invaders.

It would also be important to compare the dates of certain events recorded in Japanese history, such as arrivals of embassies, invasions etc. with the dates assigned to them in the records of Corea and China.

It will not be out of place here to make a few remarks regarding certain Japanese works purporting to give us full details of the yearly calendars, as used in Japan, from the very remotest days, and therefore apparently opposed to the theory raised by me. There are several works of the kind, but as they are all reproductions of the same original, I shall by examining one have disposed of all. The *Kicō-wa-tsū-rēki*, 皇和通曆, is a work in three volumes, of which one gives us a description of the various calendars that have been in use in Japan, while the remaining two contain the yearly calendars commencing with *eight years before Jimmu Tennō's* reign began, showing in a separate column for each year the long and short months as well as the *E-to* of the new-year's days. On examining these calendars we find as follows:

* The first court annalists were appointed in 403, four years after *Nin-toku's* death, a measure which appears to be a most natural one in connection with an official re-organization of the years.

The first volume mentions that the Chinese calendar called the *Gen-ka Reki* was introduced into Japan in the year 690 A.D., and remained in use until 697; that thereafter the *Gi-hō Reki* was used until the year 764, when the *Dai-en Reki* was adopted. When, however, we turn to the other volumes, which give the yearly calendars from 690 till 764, we find that these do not at all agree with the rules and formulæ that characterize the *Gen-ka* and *Gi-hō Reki*. The *Gen-ka Reki* can never have two short months following each other, and yet we find in the calendars given for the few years during which this system was used, one instance of two consecutive short months. The *Gi-hō Reki*, on the other hand, must owing to the principles on which it is formed, show *three* short months about once in every six years; and yet the calendars given by the *Kwō-wa-tsū-reki* as those in use between 697 and 764, do not show one single such group of short months.

From the above we may draw the conclusion that though the first Chinese calendar was introduced in 690 A.D., the calendars for the years from that time up to the compilation of the earliest historical works have not been preserved, probably owing to the use of calendars not yet having become general in the country. Anxious to make the history of his country complete, the author of the *Kwō-wa-tsū-reki* or its prototype has then compiled calendars for the missing years, but unfortunately neglected to reconcile his compilation with the historical data quoted by himself; and entirely ignoring the *Gen-ka* and *Gi-hō Reki* he gives us, for the years between 690 and 764 A.D., fictitious calendars calculated according to the *Dai-en Reki*, which was the system in use when the book was written, and which does not show three short months together, except perhaps once in a hundred years.

Not satisfied with thus supplying the calendars back to the time the first Chinese calendar was introduced, the author is bold enough to undertake to give us the yearly calendars for *thirteen centuries* prior to that time, thus taking us back to some years before the reign of *Jimmu Tennō*! To give these calendars the gloss of authenticity, the author says, that during those centuries there were three different systems of calendar, Japanese by origin, in use; but he can give us no better name for them than 上古, 中古 and 晚古, "the first old," "the middle old" and "the last old,"—names that of course were never given to any calendars when in use. It is superfluous to say that these calendars are as fictitious as those before mentioned; the author *may* have obtained them by *calculating* backwards according to one of the numerous Chinese systems, a process which would present no difficulties; but it is much more likely that he has simply *copied* a series of Chinese calendars. In doing so, it was not even necessary that he should copy the calendars of the *corresponding* Chinese years; he might choose at random *any* starting point in the records of Chinese calendars and then, after counting backwards as many months

as required, join the part chosen to the first genuine *Japanese* calendar at his disposal ; in this manner he would in reality have done nothing but counting backwards by lunations, and the result of the operation would therefore, as far as correctness goes, be such a system of Calendars as *might* perfectly well have been used by the Japanese, had they had any calendars at all in those days.

This whole system of fictitious dates has thereafter been applied in the first histories of Japan ; in fact there can hardly be any doubt, that the object in compiling them was to put them to this very use, and that the compilation was simultaneous and connected with that of the *Nihon-gi*, which latter work gives the month and date of the very earliest events, accompanied by the *E-to* of the day, always in strict conformity with the calendars given in the *Kuō-wa-tsū-reki*. Yet the same work announces many centuries later the introduction of the written character, the importation of the instruments required for calculating calendars, the erection of the first astronomical observatory, and the formal introduction of Calendars ! It is hardly too severe to style this one of the greatest literary frauds ever perpetrated, from which we may infer how little trust can be placed in the early Japanese historical works.

As the calendars given in the *Kuō-wa-tsū-reki*, and consequently also the data of the *Nihon-gi*, prior to the year 764 A.D., are not in conformity with the systems actually used, we must infer that both of these books were written *after* the said year ; how long after, we cannot say, for although from that year the calendars given by the *Kuō-wa-tsū-reki* are in conformity with the *system* really in use at the time, it is quite possible that the yearly calendars given for some time after that year are not those actually used.

We have now no difficulty in explaining a circumstance which seems to have caused no little surprise to eminent authors as Ph. Fr. von Siebold, and Dr. J. J. Hoffmann, namely the fact, that the new-year's day on which according to the *Nihon-gi* Jimmu Tennō ascended the throne, and which is said to have been the 17th of a cycle of 60 days, can be proved to be a day on which it was really new-moon. Siebold, in mentioning this, at first sight, striking fact says : that while it is uncertain when the sexagenary cycle first came into use in Japan, it is evident from the *Nihon-gi* that the system must have been in use in the earliest days of the Mikado dynasty, because, though it might be easy in the case of *years* to carry the sexagenary cycle back till Jimmu's time, it would hardly be possible, after the lapse of thirteen centuries to calculate the *days* in the same way, with such correctness as is evinced in the *Nihon-gi*, where we find that the 1st day of the 1st

year of Jimmu Tennō's reign actually falls on what can be proved to have been the day of a new-moon. Dr. Hoffmann expresses himself as follows: "After the calculation of Professor Kaiser, at eight o'clock in the morning of the said day, 19th February of the year 660 B.C., there was a new moon at Miako. Therefore the correctness of the Japanese chronology may not be called in question." It is quite true that by counting back, by Julian years, we find that the day assigned as the one on which Jimmu Tennō's reign commenced, is the 19th February 660 B.C., and Prof. Kaiser's calculations to the effect, that a new moon commenced on that particular day, are undoubtedly correct. But it must be remembered, that the length of a lunation being known, it would not be more difficult to the Japanese "compiler" to make the said and other new year's days coincide with new-moons, than it was to Prof. Kaiser to test the correctness of the calendars; and if moreover, the compiler did not make any calculations at all, but merely copied his calendars from the Chinese, it could not possibly be otherwise than that the day in question must coincide with the commencement of a new moon, because thousands of years before Christ, as now, the first day of *any* Chinese month was synchronous with the day of new-moon.

I would here desire to draw attention to a certain Chinese tradition, which by some authors has been associated with Jimmu Tennō,—a connection which is opposed to the views advanced by me. Thus Professor Griffiths in his work "The Mikado's Empire," gives us the following detailed account:

"Chinese tradition ascribes the peopling of Japan to the following causes: The Grand-father (Taiko) of the first emperor (Buwo) of the Shu dynasty (thirty seven emperors, eight hundred and seventy two years, B.C. 1120-249) in China, having three sons, wished to bequeath his titles and estates to his youngest son, notwithstanding that law and custom required him to endow the eldest. The younger son refused to receive the inheritance; but the elder, knowing that his father Taiko would persist in his determination, and unwilling to cause trouble, secretly left his father's house and dominions, and sailed away to the South of China. Thence he is supposed to have gone to Japan and founded a colony in Hiuga. His name was Taihaku Ki. This event took place about forty-six years before the usually accepted date of Jimmu's departure from Hiuga upon his career of conquest."

And it is added in a foot-note, that *Kishi koku*, one of the names of Japan, is also translated "country of the Ki family" (*shi* family; *koku*, country) and that the Chinese still apply this name to Japan.

There is undoubtedly some error in this calculation: Without taking into consideration that the said question of inheritance between the sons of *Taiko*, *Buwo's* grandfather, must have taken place several years before *Buwo* ascended the

throne, we need but to compare the year given by Professor Griffis as the one in which *Buwo's* reign commenced, viz: 1120 B.C., with the "usually accepted" year for *Jimmu's* entering *Kashirabara*, 660 B.C., to see that the former event took place 460, not 46 years before the latter, and that consequently this tradition, which by first sight might appear to be one of significance, as tending to throw some light on the exact time of *Jimmu's* invasion, cannot possibly have any connection with the latter.*

* Bu-wo actually ascended the throne in 1104 B.C.

DIRECTIONS

FOR THE USE OF THE CHRONOLOGICAL TABLES.

The Index Page 45 contains all *Nen-gō* arranged alphabetically, according to the pronunciation.

A *Nen-gō* may often be pronounced in two or three different ways. These various pronunciations are all given in the Index.

Two differently written *Nen-gō* are sometimes pronounced alike. Some precaution must therefore be taken to distinguish between the two. For this purpose the Chinese characters of each *Nen-gō* have been added in the Index; and as a further check each page of the tables contains, in the upper margin, the characters of the different *Nen-gō* found on the page.

When, owing to civil wars, two different *Nen-gō* were used simultaneously, both have been given in the tables.

In a separate Index the *Nen-gō* have been arranged according to the Chinese characters wherewith they are written. In using this index, commence by finding the *first* character of the *Nen-gō*, among the headings in heavy type. Then find under this heading the remaining character; and the number found in the same square will indicate the page of the tables, on which the *Nen-gō* sought is given. To facilitate the use of the Index, the said headings, as well as the characters given under each heading, are arranged according to the number of strokes they contain.

The Japanese intercalary months are all given in the last column of the tables, irrespective of their true position. The real place of each is, however, marked by an asterisk after the month it follows; besides which a glance at the dates given will at once show where the intercalary month must come in.

Remember that February, in these tables, has 29 days in all years that may be divided by 4, *except* 1700 and 1800, in which two years it has but 28.

On a separate page, at the end of the book, will be found the date of the Julian or Gregorian calendar corresponding to *each day* of the Japanese month during which the change of calendar was effected by Pope Gregory XIII, (*Ten-shō* 10th year 9th month, or Sept. 17th to October 26th, 1582).

The Gregorian Calendar was introduced into Italy, Spain and Portugal in 1582, by calling what should have been the 5th October, the 15th. The present tables have been calculated on these data, and will therefore prove correct right through, as far as the three countries named are concerned.

The Gregorian Calendar was, however, but gradually adopted by other countries :

1582, by *France*, by making what should have been the 10th December, the 20th.

1700, by the Protestant states of *Germany*, by making the 16th February = the 1st March.

1752, by *England*, by making the 3rd September = the 14th.

In *Russia*, the Gregorian Calendar has not yet been adopted.

It consequently becomes necessary, when comparing Japanese dates with those of the countries here mentioned, to deduct a certain number of days from the dates given in these tables :

WHEN COMPARING JAPANESE DATES WITH THOSE OF	FROM THE DATES GIVEN IN THE TABLES BETWEEN AND		DEDUCT	REMARKS.
FRANCE	15th October 1582	19th December 1582	10 days	
GERMANY (Protestant countries) ...	15th October 1582	28th February 1700	10 days	
ENGLAND	15th October 1582	10th March 1700	10 days	(11th March 1700 of the Tables = 29th Feb. 1700 of the English calendar.
	12th March 1700	18th September 1752	11 days	
RUSSIA	15th October 1582	10th March 1700	10 days	(11th March 1700 of the Tables = 29th Feb. 1700 of the Russian calendar. (12th March 1800 of the Tables = 29th Feb. 1800 of the Russian calendar.
	12th March 1700	11th March 1800	11 days	
	18th March 1800	the last day of the Tables	12 days	

It must be borne in mind, that the month of February in England, in 1700, and in Russia, in 1700 and 1800, has 29 days, while in the Gregorian Calendar, and consequently also in these tables, it has but 28 days. That this may not lead to any error in deducting the necessary number of days, as above directed, the dates of the Gregorian Calendar, corresponding to the 29th Feb. (Julian Calendar) of the years aforementioned, have been given in the Remarks' Column.

EXAMPLES.

What day, in any European country, corresponds to

Bun-ei 5th year, 4th month 13th day ?

The tables give :

" " " " " 1st day 14th May 1268.

As we want the equivalent of the 13th day, add 12

which gives us 26th May 1268.

What day of the *Italian* Calendar corresponds to

Gen-roku 4th year, Intercalary 8th month, 15th day ?

The tables give " " " " " " 1st day 22 Sept. 1691.

As we want the equivalent of the 15th day, add 14

September having 30 days

We get 6th Oct. 1691.

If, instead, we want to compare the same Japanese day with *English* dates, we have by the tables :

Gen-roku 4th year, Intercalary 8th month, 1st day 22 Sept. 1691.

As we want the equivalent of the 15th day, add 14

36

As, however, the Gregorian Calendar was not then in use in England, deduct 10

Which gives us 26th Sept. 1691.

What day, in any country in Europe and America, (Russia excepted), corresponds to

Mei-ji 1st year, 2nd month, 10th day?

The tables give " " " " " 1st day 23rd Feb. 1868.

As we desire the equivalent of the 10th day, add 9

32

1868 being a leap-year, February has 29 days

Which gives us 3rd March 1868.

If we compare the same Japanese day with the *Russian* Calendar, we
must deduct 12 from 32, which gives us, 20th Feb. 1868.

---	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------

DIRECTIONS

HOW TO CALCULATE THE *E-TO* OF ANY YEAR, MONTH OR DAY.

E-to of the year. In the Chronological Tables a number is given for each year, under the heading **Year by cycle**. This number may be interpreted, by aid of the accompanying Table I*, by reading off the Chinese character, to the left of the number, followed by the character in a line above. Thus 38 means 辛丑, *Ka-no-to, ushi*. It will facilitate the use of this table to remember, that all numbers ending in 1 are found in the first horizontal line; those in 2 in the second, and so on.

E-to of the month. This may always be ascertained by Table II*, if the year from *Jimmu Tennō*, or the year of the Christian era corresponding thereto, is known. Thus, if we desire to find the *E-to* of the 4th month of the 5th year of *Bum-mei*, we first ascertain by the Chronological Tables, that the said year is the 2188rd after *Jimmu Tennō*, or 1478 A.D., consequently the *E-to* of the 4th month is 54, which interpreted by Table I means 丁巳, *Hi-no-to, mi*.

Note.—When speaking of the year by the Christian era corresponding to a Japanese year, this must always be taken to mean the Christian year corresponding to the *first* part of the Japanese year, notwithstanding the last month of the latter may extend into another Christian year. Thus if we want to ascertain the *E-to* of the 12th month of the 8th year of *Ei-kiō*, we must consider 1486 A.D. the corresponding year, although the month in question, being the last of the year, only commences in January 1487.

E-to of the day. The accompanying Tables III and IV, used in connection with the Chronological Tables and Table I, will serve a three-fold purpose:

1st. For ascertaining the *E-to* corresponding to any European, or *modern* Japanese date. The latter may at times be required, as though the Gregorian calendar is now used in Japan, the days are still sometimes counted by *E-to*.

2nd. For ascertaining the *E-to* of any Japanese date, prior to the introduction of the Gregorian calendar in Japan.

3rd. For ascertaining the *date* of the Japanese month, when the day by the cycle is known. This will be useful in such cases where Japanese books give the year and month only, accompanied by the *E-to* of the day.

* This table has already been given on a former page, but is reproduced here, as it will be convenient to have all the tables, that are used in this connection, together.

The rules for using Tables III and IV are as follows :

I. When desirous of finding the E-to corresponding to a known European date :

Take in Table III the number corresponding to the given year.

Take in Table IV the number corresponding to the given date.

Add the two.

The sum, if not exceeding 60, will be the number corresponding to the *E-to*, and may be interpreted by Table I.

If the sum exceeds 60, divide by 60, and the remainder, interpreted by Table I, is the *E-to* sought.

Should there be no remainder, the *E-to* is the 60th of the cycle, 癸亥.

Example 1. What is the *E-to* of the 19th January 1159 ?

Table III gives for 1159	33
Table IV gives for 19th January	18
Total	<u>51</u>

This number, interpreted by Table I, gives us 甲寅, *Ki-no-e, tora*, as the *E-to* sought.

Example 2. What *E-to* will correspond to the 11th August 1896 ?

Table III gives for 1896	50
Table IV gives for 11th August. 222	
As it is leap-year, add	1
	<u>223</u>
Total	<u>273</u>

Divided by 60, this gives a remainder of 33, which by Table I means 丙申, *Hi-no-e, saru*.

II. When the E-to corresponding to any known Japanese date is wanted :

Ascertain the corresponding European date by the aid of the Chronological Tables, and then proceed as above.

Example. What is the *E-to* of the 19th day, 5th month, 3rd year of *Wa-dō*?

Wa-dō 3rd year, 5th month, 1st day = 2nd June 710

Consequently the 19th day is 20th June 710.

Table III gives for 710 16

Table IV gives for 20th June 170

Total 186

Divided by 60, this gives a remainder of 6, consequently the *E-to* sought is 己巳, *Tsuchi-no-to mi*.

III. When the date of the Japanese month is wanted, in cases where the Japanese year and month, and the day by the cycle is given:

Ascertain by the Chronological Tables the European year and date corresponding to the 1st day of the given month.

Find the number in Table III corresponding to the year.

Find the number in Table IV corresponding to the date.

Add the two.

Deduct 1 from the total.

Deduct the number thus obtained, from the number corresponding to the given *E-to*, after having added to the latter, if necessary, as many times 60, as will make it larger than the number that is to be deducted from it.

The result will be the date sought.

Example 1. What date of the Japanese month corresponds to *Kwam-bun* 10th year 12th month, the day of *Mizu-no-e, tatsun* 壬辰?

Kwam-bun 10th year, 12th month, 1st day 11th January 1671.

Table III gives for 1671	11
Table IV gives for 11 January	10
	<hr/>
	21
Deduct	1
	<hr/>
	20
The number corresponding to <i>Mizu-no-e, tatsu</i> is	29
	<hr/>
Difference	9
	<hr/>

The date sought is the 9th of the month.

Example 2. What date of the Japanese month corresponds to *Ei-nin* 3rd year, 4th month, the day of 庚午, *Ka-no-e, uma*?

Ei-nin 3rd year, 4th month, 1st day = 16th May 1295.

Table III gives for 1295	27
Table IV gives for 16th May	135
	<hr/>
	162
Deduct from this	1
	<hr/>
	161
The number corresponding to <i>Ka-no-e, uma</i> is	7
To this must be added 3×60	180
	<hr/>
Difference	187
	<hr/>
	26, the date sought.
	<hr/>

If, instead, we want to compare the same Japanese day with *English* dates, we have by the tables :

Gen-roku 4th year, Intercalary 8th month, 1st day - 22 Sept. 1691.

As we want the equivalent of the 15th day, add 14

36

As, however, the Gregorian Calendar was not then in use in England, deduct 10

Which gives us 26th Sept. 1691.

What day, in any country in Europe and America, (Russia excepted), corresponds to

Mei-ji 1st year, 2nd month, 10th day?

The tables give " " " " " 1st day 23rd Feb. 1868.

As we desire the equivalent of the 10th day, add 9

32

1868 being a leap-year, February has 29 days

Which gives us 3rd March 1868.

If we compare the same Japanese day with the *Russian* Calendar, we must deduct 12 from 32, which gives us

20th Feb. 1868.

Table III gives for 1671	11
Table IV gives for 11 January	10
	<hr/>
	21
Deduct	1
	<hr/>
	20
The number corresponding to <i>Mizu-no-e, tatsu</i> is	29
	<hr/>
Difference	9
	<hr/>

The date sought is the 9th of the month.

Example 2. What date of the Japanese month corresponds to *Ei-nin* 3rd year, 4th month, the day of 庚午, *Ka-no-e, uma*?

Ei-nin 3rd year, 4th month, 1st day = 16th May 1295.

Table III gives for 1295	27
Table IV gives for 16th May	135
	<hr/>
	162
Deduct from this	1
	<hr/>
	161
The number corresponding to <i>Ka-no-e, uma</i> is	7
To this must be added 3×60	180
	<hr/>
Difference	187
	<hr/>
	26, the date sought.

In the 5th year of Meiji (1872) the Japanese lunar months, and to adopt in its stead the solar months, of the 12th month fell on the 31st December leaving out the remainder of the said 12th month of the 5th year of Meiji, was called the 13th month (corresponding to the 1st January 1873).

The system of counting the years by the

1871-1873 A. D.

1ST DAY OF 6TH MONTH.	1ST DAY OF 7TH MONTH.	1ST DAY OF 8TH MONTH.	1ST DAY OF 9TH MONTH.	1ST DAY OF 10TH MONTH.	1ST DAY OF 11TH MONTH.	1ST DAY OF 12TH MONTH.	1ST DAY OF INTERC: MONTH.
18 July 1871	16 Aug 1871	15 Sep 1871	14 Oct 1871	13 Nov 1871	12 Dec 1871	10 Jan 1872	
6 July 1872	4 Aug 1872	3 Sep 1872	3 Oct 1872	1 Nov 1872	1 Dec 1872	30 Dec 1872	
1 June 1873	1 July 1873	1 Aug 1873	1 Sep 1873	1 Oct 1873	1 Nov 1873	1 Dec 1873	

Government decided to discontinue the system of
gorian Calendar. As in that year the 2nd day
the change to the new calendar was effected by
Thus the day following on the 2nd day of the 12th
day of the 1st month of the 6th year of Meiji

(*Nen-gō*) remains unchanged.

Below are given the dates of the Julian or Gregorian Calendar corresponding to each day of the Japanese month during which the latter calendar was inaugurated in Europe by Pope Gregorius.
